

TAKES THE STRAIN

NEW

HCS SERIES SNAP-ACTION SWITCHES WITH REINFORCED MOUNTING HOLES

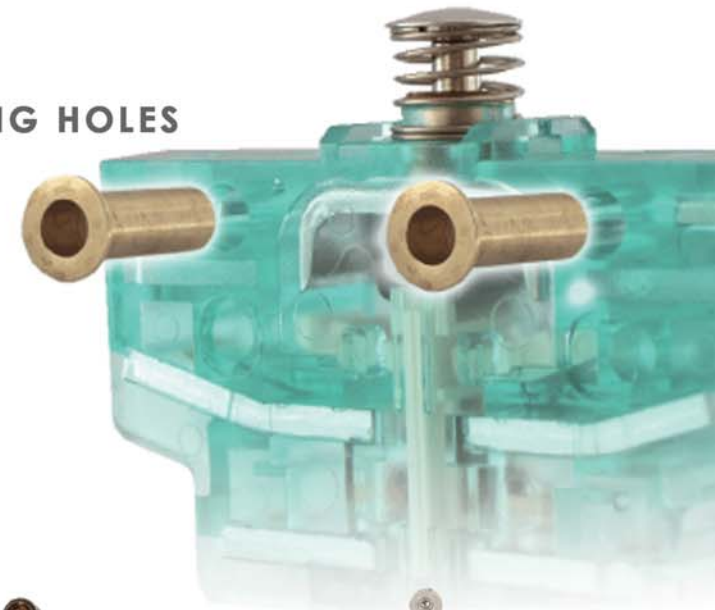

It's no fault of the standard switch but many of our clients have confided that they have great difficulty in avoiding over tightening of the switches during assembly.

However much they try, there will always be the opportunity for an assembler to over tighten the device, pinching the mechanism or damaging the plastic case.

The consequences of this in safety-critical equipment such as door controls does not require further elaboration.

Hertford Controls can now offer genuine Schaltbau switches S800, S826, S847, S820 and S850 with mounting holes strengthened by way of hollow brass inserts.

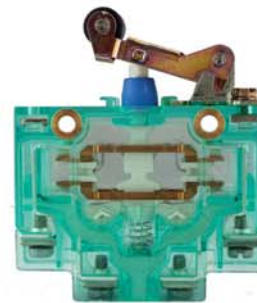

This takes the strain off the case and the assembler at the same time!
